

Dataset Filtering and Characteristics of SciTables

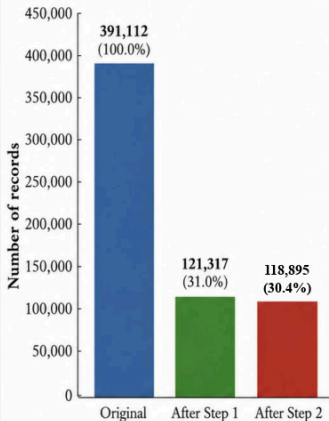

A Filtering Pipeline

1 Step 1: retain entries with a single paragraph reference and a specific table reference.

2 Step 2: retain descriptions with 100–500 tokens.

B Record Counts After Filtering

C Dataset Characteristics

Property	Value
Rows per Table (mean $\pm$ std)	6.7 $\pm$ 7.3
Columns per Table (mean $\pm$ std)	4.9 $\pm$ 3.6
Multi-level Headers	36.5%
Decimal / Precision-heavy cells	46.1%
Text-only cells	21.4%
Numeric-only cells	43.4%
Symbolic-only cells	2.3%
Numeric + Symbolic cells	5.0%
Text + Numeric cells	13.4%
Formula / Mathematical Expression cells	14.5%
Numeric Density Score	0.371
Compression Ratio	5.609

Numeric Density Score is the ratio of numeric and symbolic cells to the total number of cells. Compression Ratio is the ratio of table tokens to tokens in the corresponding reference paragraph.

Figure: Overview of the SciTables dataset construction and its structural and content characteristics. (A) Two-step filtering pipeline applied to the collected tables. (B) Number of records at each stage with the percentage retained relative to the original. (C) Summary of structural and content characteristics of the final dataset.
